hypothetical protein lin0353 [imported] - Listeria innocua (strain Clip11262)
G.Species: Listeria innocua
C.Species: Disteria innocua
C.Species: J. Nov-2001
C.Species: J. Baquero, F.; Buchrieser, C.; Amend, A.; Baquero, F.; Berche, P.; Bloecker
S.; Dominguez-Bernal, G.; Duchaud, E.; Durand, L.; Dussurget, O.; Entian, K.D.; Fsihi, H.
D.; Jones, L.M.; Karst, U.
Science 294, 849-852, 2001

A) Title: The complete DNA sequence of Autographa californica nuclear polyhedrosis virus.
A,Reference number: A72850; MUID:94303173; PMID:8030224
A,Accession: H72851
A,Accession: H72851
A,Accession: H72851
A,Accession: H72851
A,Accession: Transinary
A,Molecule type: DNA
A,Residues: 1-225 < carry
A,Molecule type: DNA
A,Cross-references: GB:L22888; NID:9510708; PIDN:AAA66646.1; PID:9559085
C,Comment: The gene is located in a 3-kilobase Xbal genome fragment.
C,Comment: This protein is required for viral late gene expression.
genomic organization of the EcoRI-A fragment of Autographa californid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          o;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 "Lipophilin, a novel heterodimeric protein of human tears.";
FEBS Lett. 432:163-167(1998)
-!- FUNCTION: MAY BIND ANDROGENS AND OTHER STEROIDS, MAY ALSO BIND
-:- FUNCTION: MAY BIND ANDROGENS AND OTHER STEROIDS, MAY ALSO BIND
-:- STRAMUGYINE, A CHEMOTHERAPEUTIC AGENT USED FOR PROSTATE CANCER.
MAY BE UNDER TRANSCRIPTIONAL REGULATION OF STEROID HORMONES.
-!- STBUNIT: HETERODIMER OF A LIPOPHILIN A AND A LIPOPHILIN C
[MAMMAGLOBIN B) MONOMER ASSOCIATED HEAD TO HEAD.
-!- TISSUE SPECIFICITY: Expressed in thymus, trachea, kidney, steroid responsive tissues (prostate, testis, uterus, breast and ovary)
                                                                                                                                                                                                                                30-MAY-2000 (Rel. 39, Last sequence update)
15-MAR-2004 (Rel. 43, Last annotation update)
Mammaglobin B precursor (Mammaglobin 2) (Lipophilin C) (Lacryglobin)
SCGREtoglobin family 2A member 1).
SCGB2A1 OR MGB2 OR UGB3 OR LIPHC.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              and salivary gland.
MASS SPECTROMETRY: MW-8854.94; METHOD=Electrospray; RANGE=19-95.
SIMILARITY: Belongs to the uteroglobin family. Lipophilin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        MEDLINE=98385871; PubMed=9720917;

Biochem. J. 357:673-688 (2001)

-!- FUNCTION: Possible adhesion molecule with a role in early hematopoiesis by mediating attachment to stromal cells. Influences the survival and/or proliferation of B cell precursors. Binding to cells requires Mm(II) (By similarity)

-!- SUBGNAT: Oligomer with STIM1 (By similarity)

-!- SUBCELIULAR LOCATION: Type I membrane protein. Cell surface
                                                                       STRAIN=C57BL/6J; TISSUE=Skeletal muscle;

-! CATALYIC ACTIVITY: (-)-ureidoglycolate + H(2)O = glyoxylate + 2 NH(3) + CO(2).

-! PATHWAY: Degradation of allantoin (purine catabolism); third step.
-! SIMILARITY: Belongs to the ureidoglycolate hydrolase family.
                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           pneumoniae.";

Nucleic Acids Res. 24:4420-4449(1996),

Nucleic Acids Res. 18-3 binds to the 30S ribosomal subunit and shifts the equilibrum between 70S ribosomes and their 50S and 30S subunits in favor of the free subunits, thus enhancing the availability of 30S subunits on which protein synthesis initiation begins.

-!- SUBUNIT: Monomer (By similarity).

-!- SUBCELLULAR LOCATION: Cytoplasmic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    -1- FUNCTION: BINDS TO THE 5S RRNA.
-!- SIMILARITY: Belongs to the L25P family of ribosomal proteins.
-!- CATALYTIC ACTIVITY: dCTP + H(2)O = dUTP + NH(3).
-!- CATALYTIC ACTIVITY: dUTP + H(2)O = dUMP + diphosphate.
-!- COFACTOR: Magnesium.
-!- ENZYME REGULATION: Inhibited by dTTP.
-!- PATHWAY: De novo synthesis of thymidylate.
-!- SABUNIT: Homohexamer (Probable).
-!- MASS SPECTROMETRY: MW=23619; MW ERR=94; METHOD=MALDI.
-!- MASC SPECTROMETRY: MW=24619; MG ERR=94; METHOD=MALDI.
-!- MISCELLANEOUS: Optimal DH is 7.5. Retained over 70% of its activity when heated at 90 degrees Celsius for 10 min.
-!- SIMILARITY: Belongs to the dCTP deaminase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gryaznova O.I., bavydova N.L., Gongadze G.M., Jonsson B.-H., Garber M.B., Liljas A.;

"Structural analysis and activation by fungal infection of a gene encoding a pathogenesis-related protein in potato.";

Mol. Plant Microbe Interact. 3:72-77(1990).

-! CATALYTIC ACTIVITY: Rx + glutathione = HX + R-S-glutathione.

-! INDUCTION: By fungal infection.

-! SIMILARITY: Belongs to the GST superfamily. HSP26 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ..

"Genome-based analysis of virtulence genes in a non-biofilm-forming

Staphylococcus epidermidis strain (APCC 12228) .",

Mol. Microbiol. 49:1577-1593(2003)

-!-FUNCTION: Transforms pimelate into pimeloyl-CoA (By similarity).

-!- CHTALYTIC ACTIVITY: ATP + 6-carboxyhexanoate + CoA = AMP +

diphosphate + 6-carboxyhexanoyl-CoA.

-!- COPACTOR: Magnesium (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Q8CTZ3;

Weiss R.B., Dunn D.M., Robb F.T., Brown J.R.;
Weiss R.B., Dunn D.M., Robb F.T., Brown J.R.;
Submitted (FEB-2002) to the EMBL/GenBank/DDBJ databases.
-! CATALYTIC ACTIVITY: D-ribose 5-phosphate = D-ribulose 5-phosphate.
-! PATHWAY: Nonoxidative branch of the pentose phosphate pathway.
-! SIMILARITY: Belongs to the ribose 5-phosphate isomerase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Archaea; Buryarchaeota; Thermococci; Thermococcales; Thermococcaceae;

-!- FUNCTION: Methyltransferase required for the conversion of dimethylmenaquinone (DMKH2) to menaquinone (MKH2) (By similarity).
-!- CATALYTIC ACTIVITY: Sadenosyl-L-methionine + demethylmenaquinol s-adenosyl-L-homocysteine + menaquinol.
-!- PATHWAX: Menaquinone biosynthesis; last step.

"Molecular characterization of the mitochondrial DNA of a new stopper mutant ER-3 of Neurospora crassa.";

Genetics 120:935-945(1988)

-!- FUNCTION: Cytochrome c oxidase is the component of the respiratory

-!- FUNCTION: Cytochrome c oxidase is the component of the respiratory

chain that catalyzes the reduction of oxygen to water. Subunits 1-

3 form the functional core of the enzyme complex. Subunit 2

transfers the electrons from cytochrome c via its binuclear copper

A center to the binnetalic center of the catalytic subunit 1.

-!- CATALYTIC ACTIVITY: 4 ferrocytochrome c + O(2) = 4 ferricytochrome
                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      MEDLINE-83054012; PubMed=6291999; van den Boogaart P., van Dijk S., Agsteribbe E.; "The mitochondrially made subunit 2 of Neurospora crassa cytochrome aa3 is synthesized as a precursor protein."; FEBS Lett. 147:97-100(1982).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           c + 2 H(2)0.

                                                                                                                                                                                                                                                            -!- SUBUNIT: Part of the 30S ribosomal subunit. Forms a tight cowith proteins 510 and 514 (By similarity).
-!- SIMILARITY: Belongs to the 53P family of ribosomal proteins.
-!- SIMILARITY: Contains 1 KH type-2 domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         .

-:- FUNCTION: Binds the lower part of the 30S subunit head. Binds mRNA
in the 70S ribosome, positioning it for translation (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       -!- SUBUNIT: Part of the 30S ribosomal subunit. Forms a tight complex with proteins 310 and 314 (By similarity).

with Belongs to the S3P family of ribosomal proteins.

-!- SIMILARITY: Belongs to the S3P family of ribosomal proteins.

-!- SIMILARITY: Concains 1 KH type-2 domain.
                subunit. Forms a tight complex
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                -!- SUBUNIT: Part of the 30S ribosomal subunit. Forms a tight con with proteins S10 and S14 (Bs similarity).
-!- SIMILARITY: Belongs to the S3P family of ribosomal proteins.
-!- SIMILARITY: Contains 1 KH type-2 domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    .

H.;
J. Biol. Chem. 268:17648-17649(1993).
-!- FONCTION: THIS PERIPLASMIC BINDING PROTEIN IS INVOLVED IN AN ARGININE TRANSPORT SYSTEM. ARGI AND HISTIDINE-BINDING PROTEIN J (HISJ) INTERACT WITH A COMMON MEMBRANE-BOUND RECEPTOR, HISP.
-!- SUBCELULIAR LOCATION: Periplasmic.
-!- SIMILARITY: Relongs to the bacterial extracellular solute-binding
                                                                               X-RAY CRYSTALLOGRAPHY (1.8 ANGSTROMS).

-!- FUNCTION: Digests double-stranded RNA. Involved in the processing of ribosomal RNA precursors and of some mRNAS (By similarity).
-!- CATALYTIC ACTIVITY: Endonucleolytic cleavage to 5'-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     phosphomonoester.
--- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
---- SIMILARITY: Contains 1 DRBM (double-stranded RNA-binding) domain.
---- SIMILARITY: Contains 1 RNase III domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        [1]

MEDLINE=93346250; PubMed=8346241;

Stevenson F.T., Bursten S.L., Fanton C., Locksley R.M., Lovett D.H.;

Stevenson F.T., Bursten S.L., Fanton C., Locksley R.M., Lovett D.H.;

The 31-kDa precursor of interleukin 1 alpha is myristoylated on specific lysines within the 16-kDa N-terminal propiece.",

Proc. Natl. Acad. Sci. U.S.A. 90:7245-7249(193).

-!- PUNCTION: PRODUCED BY ACTIVATED MACROPHAGES, IL-1 STIMULATES

THYMOCYTE PROLIFERATION BY INDUCING IL-2 RELEASE B-CELL

MATURATION & PROLIFERATION & FIRROBLAST GROWTH FACTOR ACTIVITY.

IL-1 PROTEINS ARE INVOLVED IN THE INFLAMMATORY RESPONSE, BEING

CHERRASE OF PROSTAGLANDIN AND COLLAGENASE FROM SYNOVIAL CELLS. X-RAY CRYSTALLOGRAPHY (2.7 ANGSTROMS). MEDLINE=92268016; PubMed=2346741; Graves B.J., Hatada M.H., Hendrickson W.A., Miller J.K., Madison V.S., "Structure of interleukin 1 alpha at 2.7-A resolution.";

DOMAIN: THE SIMILARITY AMONG THE IL-1 PRECURSORS SUGGESTS THAT THE AMINO ENDS OF THESE PROTEINS SERVE SOME AS YET UNDEFINED FUNCTION. ANSCELLANDOUS: THE LACK OF A SPECIFIC HYDROPHOBIC SEGMENT IN THE PRECURSOR SEQUENCE SUGGESTS THAT IL-1 IS RELEASED BY DAMAGED CELLS OR IS SECRETED BY A MECHANISM DIFFERING FROM THAT USED FOR OTHER SECRETCRY PROTEINS.

SIMILARITY: Belongs to the IL-1 family.
